.NET 9 App Dev Hands-On Lab

MVC Lab 3 –Pipeline Configuration, Dependency Injection

This lab configures the HTTP pipeline and configures the configuration and dependency injection. Before starting this lab, you must have completed MVC Lab 2b.

Part 1: Configure the Application

Step 1: Update the Development App Settings

- Update the `appsettings.Development.json` in the `AutoLot.Mvc` project to the following (adjusted for your connection string and ports): Note the comma added after "AutoLot.Mvc - Dev"

```
{
  "AppLoggingSettings": {
    "MSSqlServer": {
      "TableName": "SeriLogs",
      "Schema": "Logging",
      "ConnectionStringName": "AutoLot"
    },
    "File": {
      "Drive": "c",
      "FilePath": "temp",
      "FileName": "log_AutoLot_Debug.txt"
    },
    "General": {
      "RestrictedToMinimumLevel": "Information"
    }
  },
  "AppName": "AutoLot.Mvc - Dev",
  "RebuildDataBase": true,
  "ConnectionStrings": {
    //SQL Server Local Db
    "AutoLot": "Server=(localdb)\\MSSQLLocalDB;Database=AutoLot_Hol;Trusted_Connection=True;"
    //"AutoLot": "Server=(localdb)\\ProjectModels;Database=AutoLot_Hol;Trusted_Connection=True;"
    //Docker
    //"AutoLot": "Server=.,5433;Database=AutoLot_Hol;User ID=sa;Password=P@ssw0rd;"
  },
  "DealerInfo": {
    "DealerName": "Skimedic's Used Cars Development MVC Site",
    "City": "West Chester",
    "State": "Ohio"
  }
}
```

Step 2: Add the Staging Settings File

- Add a new file named `appsettings.Staging.json` to the root of the `AutoLot.Mvc` project and update it to the following:

```
{
  "AppLoggingSettings": {
    "MSSqlServer": {
      "TableName": "SeriLogs",
      "Schema": "Logging",
      "ConnectionStringName": "AutoLot"
    },
    "File": {
      "Drive": "c",
      "FilePath": "temp",
      "FileName": "log_AutoLot_Staging.txt"
    },
    "General": {
      "RestrictedToMinimumLevel": "Information"
    }
  },
  "AppName": "AutoLot.Mvc - Staging",
  "RebuildDataBase": false,
  "ConnectionStrings": {
    //SQL Server Local Db
    "AutoLot": "Server=(localdb)\\MSSQLLocalDB;Database=AutoLot_Hol;Trusted_Connection=True;"
    //"AutoLot": "Server=(localdb)\\ProjectModels;Database=AutoLot_Hol;Trusted_Connection=True;"
    //Docker
    //"AutoLot": "Server=.,5433;Database=AutoLot_Hol;User ID=sa;Password=P@ssw0rd;"
  },
  "DealerInfo": {
    "DealerName": "Skimedic's Used Cars Staging MVC Site",
    "City": "West Chester",
    "State": "Ohio"
  }
}
```

Step 3: Update the AppSettings.json file

- Update the `appsettings.json` in the `AutoLot.Mvc` project to the following:
  Note the added comma after "*":

```
{
  "AllowedHosts": "*",
  "DealerInfo": {
    "DealerName": "Skimedic's Used Cars",
    "City": "West Chester",
    "State": "Ohio"
  }
}
```

Step 4: Update the Production Settings File

- Update the `appsettings.Production.json` in the `AutoLot.Mvc` project to the following:
  Note the comma added after "AutoLot.Mvc"

```
{
  "AppLoggingSettings": {
    "MSSqlServer": {
      "TableName": "SeriLogs",
      "Schema": "Logging",
      "ConnectionStringName": "AutoLot"
    },
    "File": {
      "Drive": "c",
      "FilePath": "temp",
      "FileName": "log_AutoLot.txt"
    },
    "General": {
      "RestrictedToMinimumLevel": "Error"
    }
  },
  "AppName": "AutoLot.Mvc",
  "RebuildDataBase": false,
  "ConnectionStrings": {
    "AutoLot": "[its-a-secret]"
  }
}
```

Part 2: Add the GlobalUsings.cs File

- Create a new file named `GlobalUsings.cs` in the `AutoLot.Mvc` project and update the contents to the following:

```
global using AutoLot.Dal.EfStructures;
global using AutoLot.Dal.Initialization;
global using AutoLot.Dal.Repos;
global using AutoLot.Dal.Repos.Interfaces;
global using AutoLot.Mvc.Models;
global using AutoLot.Services.Logging.Configuration;
global using AutoLot.Services.Logging.Interfaces;
global using AutoLot.Services.Simple;
global using AutoLot.Services.Simple.Interfaces;
global using AutoLot.Services.ViewModels;
global using Microsoft.AspNetCore.Mvc;
global using Microsoft.AspNetCore.Mvc.Infrastructure;
global using Microsoft.EntityFrameworkCore;
global using Microsoft.Extensions.DependencyInjection.Extensions;
global using Microsoft.Extensions.Options;
global using Microsoft.EntityFrameworkCore.Diagnostics;
global using System.Diagnostics;
global using System.Text.Json.Serialization;
```

Part 3: Update the Program.cs Top Level Statements

Step 1: Add Logging

- Add `Serilog` to the `WebApplicationBuilder` and the logging interfaces to the DI container in `Program.cs` in the `AutoLot.Mvc` project:

```
var builder = WebApplication.CreateBuilder(args);
builder.ConfigureSerilog();
builder.Services.RegisterLoggingInterfaces();
```

Step 2: Update WebHost for CSS Isolation

- The CSS Isolation file is created in the development environment or when an app is published. To create the CSS file in other environments, update the web host to use static web assets:

```
builder.Services.RegisterLoggingInterfaces();
if (!builder.Environment.IsDevelopment())
{
  builder.WebHost.UseStaticWebAssets();
}
```

Step 3: Add Application Services to the Dependency Injection Container

- Add the repos to the DI container after the comment *//Add services to the container* and after the call to `AddControllersWithViews()`:

```
//Add services to the DI container
builder.Services.AddControllersWithViews();
builder.Services.AddScoped<ICarDriverRepo, CarDriverRepo>();
builder.Services.AddScoped<ICarRepo, CarRepo>();
builder.Services.AddScoped<IDriverRepo, DriverRepo>();
builder.Services.AddScoped<IMakeRepo, MakeRepo>();
builder.Services.AddScoped<IRadioRepo, RadioRepo>();
```

- Add the keyed services into the DI container:

```
builder.Services.AddKeyedScoped<ISimpleService, SimpleServiceOne>(nameof(SimpleServiceOne));
builder.Services.AddKeyedScoped<ISimpleService, SimpleServiceTwo>(nameof(SimpleServiceTwo));
```

- Add the following code to populate the `DealerInfo` class from the configuration file:

```
builder.Services.Configure<DealerInfo>(builder.Configuration.GetSection(nameof(DealerInfo)));
```

- Add the `IActionContextAccessor` and `HttpContextAccessor`:

```
builder.Services.TryAddSingleton<IActionContextAccessor, ActionContextAccessor>();
builder.Services.AddHttpContextAccessor();
```

- Add the `ApplicationDbContext`:

```
var connectionString = builder.Configuration.GetConnectionString("AutoLot");
builder.Services.AddDbContextPool<ApplicationDbContext>(
  options =>
  {
    options.ConfigureWarnings(wc => wc.Ignore(RelationalEventId.BoolWithDefaultWarning));
    options.UseSqlServer(connectionString,
      sqlOptions => sqlOptions.EnableRetryOnFailure().CommandTimeout(60));
  });
```

Step 4: Add DI Validation

- Add the code to validate DI services and scopes on building the web app:

```
builder.Services.AddControllersWithViews()
    .AddControllersAsServices()
    .AddViewComponentsAsServices()
    .AddTagHelpersAsServices();
builder.Host.UseDefaultServiceProvider(o =>
{
  o.ValidateOnBuild = true;
  o.ValidateScopes = true;
});
```

Step 5: Add Anti Forgery Token to the Entire Application

- Update the AddControllersWithViews call to the following (changes in bold):

```
builder.Services.AddControllersWithViews(options =>
{
  options.Filters.Add(new AutoValidateAntiforgeryTokenAttribute());
})
```

Step 6: Call the Data Initializer and Update the Project File

- In the section after `builder.Build()`, flip the `IsDevelopment` if block around, and add the `UseDeveloperExceptionPage` so the code looks like this:

```
// Configure the HTTP request pipeline.
if (app.Environment.IsDevelopment())
{
  app.UseDeveloperExceptionPage();

}
else
{
  app.UseExceptionHandler("/Home/Error");
  // The default HSTS value is 30 days.
  //You may want to change this for production scenarios, see https://aka.ms/aspnetcore-hsts.
  app.UseHsts();
}
```

- In the `IsDevelopment` if block, check the settings to determine if the database should be rebuilt, and it yes, call the data initializer:

```
if (app.Environment.IsDevelopment())
{
  app.UseDeveloperExceptionPage();
  if (app.Configuration.GetValue<bool>("RebuildDataBase"))
  {
    using var scope = app.Services.CreateScope();
    var dbContext = scope.ServiceProvider.GetRequiredService<ApplicationDbContext>();
    SampleDataInitializer.ClearAndReseedDatabase(dbContext);
  }
}
```

- If you converted the tables to be temporal (EF Core Lab 8), comment out the `IncludeAssets` tag for `EntityFrameworkCore.Design` in the `AutoLot.Mvc.csproj` file:

```
<PackageReference Include="Microsoft.EntityFrameworkCore.Design" Version=" [9.0.*,10.0)">
  <!--<IncludeAssets>runtime; build; native; contentfiles; analyzers;
buildtransitive</IncludeAssets>-->
  <PrivateAssets>all</PrivateAssets>
</PackageReference>
```

Step 7: Update the Routing for Attribute Routing

- Back in `Program.cs` in the `AutoLot.Mvc` project, comment out the call to `MapControllerRoute` and add the `MapControllers` call:

```
app.MapControllers();
//app.MapControllerRoute(
//        name: "default",
//        pattern: "{controller=Home}/{action=Index}/{id?}")
//    .WithStaticAssets();
```

Part 4: Add WebOptimizer

This section shows how to use `WebOptimizer` for bundling, minification, and caching. The `MapStaticFiles` method (introduced in ASP.NET Core 9) and `WebOptimizer` do not work together yet, so it must be commented out.

Step 1: Add WebOptimizer to DI Container

- Update the `Program.cs` top-level statements by adding the following code after adding the services but before the call to `builder.Build()`:

```
if (builder.Environment.IsDevelopment() || builder.Environment.IsEnvironment("Local"))
{
  builder.Services.AddWebOptimizer(false,false);
}
else
{
  builder.Services.AddWebOptimizer(options =>
  {
    //options.MinifyCssFiles(); //Minifies all CSS files
    options.MinifyCssFiles("css/**/*.css");
    //options.MinifyJsFiles(); //Minifies all JS files
    options.MinifyJsFiles("js/site.js");
    //options.MinifyJsFiles("js/**/*.js");
  });
}
var app = builder.Build();
```

Step 2: Add UseStaticFiles to the HTTP Pipeline

- Add in the call to `UseStaticFiles` and comment out the `MapStaticAssets` code in `Program.cs` as shown here:

```
app.UseHttpsRedirection();
app.UseStaticFiles();
app.UseRouting();
app.UseAuthorization();
//app.MapStaticAssets();
app.MapControllers();
```

Step 3: Add WebOptimizer to HTTP Pipeline

- Update the `Configure` method by adding the following code (**before** `app.UseStaticFiles()`):

```
app.UseWebOptimizer();
app.UseHttpsRedirection();
app.UseStaticFiles();
```

Step 3: Update _ViewImports to enable WebOptimizer Tag Helpers

- Update the `_ViewImports.cshtml` file to enable `WebOptimizer` tag helpers:

```
@using AutoLot.Mvc
@using AutoLot.Mvc.Models
@addTagHelper *, Microsoft.AspNetCore.Mvc.TagHelpers
@addTagHelper *, WebOptimizer.Core
```

Part 5: Update the Home Controller

Step 1: Update the Controller and Action method routing

- Add the Controller level route to the `HomeController` (the commented-out route shows the equivalent route using a literal instead of a token):

```
[Route("[controller]/[action]")]
//[Route("Home/[action]")]
public class HomeController : Controller
{
  //omitted for brevity
}
```

- Add `HttpGet` attribute to all Get action methods:

```
[HttpGet]
public IActionResult Index()
{
  return View();
}
[HttpGet]
public IActionResult Privacy()
{
  return View();
}
```

- Add the default, controller only, and controller/action routes to the `Index` action method (the commented-out route shows a route using just a literal):

```
//[Route("/MyHomePage")]
[Route("/")]
[Route("/[controller]")]
[Route("/[controller]/[action]")]
[HttpGet]
public IActionResult Index()
{
  return View();
}
```

Step 2: Update the constructor to a primary constructor, then add and test logging

- Remove the constructor and the logger field. Add a primary constructor to the class and inject `IAppLogging` into the constructor:

```
public class HomeController(IAppLogging<HomeController> logger) : Controller
{
  private readonly ILogger<HomeController> _logger = logger;
  //omitted for brevity
}
```

- Inject the `DealerInfo OptionsMonitor` into the `Index` method and pass the `CurrentValue` to the `View` (the view will be updated in a later lab):

```
public IActionResult Index([FromServices]IOptionsMonitor<DealerInfo> dealerOptionsMonitor)
{
  return View(dealerOptionsMonitor.CurrentValue);
}
```

- Update the `HomeController` Index method to log an error:

```
public IActionResult Index([FromServices]IOptionsMonitor<DealerInfo> dealerOptionsMonitor)
{
  logger.LogAppError("Test error");
  return View(dealerOptionsMonitor.CurrentValue);
}
```

- Run the application and make sure to launch a browser. Since the `Index` method is the default entry point for the application, just running the app should create an error file and an entry into the `SeriLog` table. Once you have confirmed that logging works, comment out the error logging code:

```
//logger.LogAppError("Test error");
```

- Inject the `SimpleService` into two new action methods and pass the message from the service to the `SimpleService` view (the view will be created in the next lab):

```
[HttpGet]
public IActionResult GetServiceOne(
  [FromKeyedServices(nameof(SimpleServiceOne))] ISimpleService service)
{
  return View("SimpleService",service.SayHello());
}

[HttpGet]
public IActionResult GetServiceTwo(
  [FromKeyedServices(nameof(SimpleServiceTwo))] ISimpleService service)
{
  return View("SimpleService",service.SayHello());
}
```

Summary

This lab added the necessary classes to the DI container and modified the application configuration.

Next steps

In the next part of this tutorial series, you will add support for client-side libraries, update the layout, and add GDPR Support.
